Key Events in Apollo 13 and the Underlying Physics

The Oxygen Tank Explosion

Physics Behind the Explosion

The oxygen tank, a cryogenic vessel, contained supercooled liquid oxygen. The explosion resulted from a combination of:

- Over-pressurization due to a thermostat switch issue.
- Material fatigue in the tank's heating elements.

The rapid phase change and expansion of supercooled liquid oxygen caused mechanical failure.

Understanding pressure-volume relationships, governed by the ideal gas law, was crucial in analyzing the explosion.

Navigating Using Physics: The Lunar Trajectory and Course Corrections

The spacecraft's trajectory was manipulated using rocket thrusters based on Newton's Third Law: every action (firing thrusters)

produced an equal and opposite reaction. Orbital mechanics calculations were essential for "free-return" trajectories, ensuring a safe return path around the Moon. Power Conservation and Energy Management With limited electrical power, engineers analyzed the conservation of energy to optimize battery usage. Thermal physics helped manage cabin temperature and prevent systems from overheating. Engineering Solutions Rooted in Physics The LM (Lunar Module) as a Lifeboat The Lunar Module was repurposed as a life raft, with physics principles guiding: Thermal insulation to maintain habitable conditions. Propellant management for course adjustments. The "NASA Engineered Solution" The famous "squib switch" fix involved understanding electrical circuits and physics of ignition systems. Re-Entry Physics and Safe Return The re-entry phase involved understanding aerodynamics, heat transfer, and g-force impacts on astronauts. The heat shield had to withstand extreme temperatures due to atmospheric friction, a classic example of thermodynamics and fluid mechanics.

Visualize Trajectories: Use diagrams and simulations to grasp orbital mechanics.

Relate Real-Life Applications: Connect physics concepts to the actual events of Apollo 13.

Practice Calculations: Work through problems involving gas laws, momentum, and energy conservation.

Use Multimedia Resources: Watch documentaries and animations that illustrate physics in space.

Sample Physics Problems Inspired by Apollo 13

Problem 1: The oxygen tank explosion increased the pressure inside the tank by 20%. Assuming the initial pressure was 2000 psi and temperature remained constant, what is the new pressure?

Solution: Using the pressure increase formula:

$$P_{\text{new}} = P_{\text{initial}} \times (1 + \frac{\Delta P}{P_{\text{initial}}})$$

$$P_{\text{new}} = 2000 \times (1 + 0.20) = 2000 \times 1.20 = 2400 \text{ psi}$$

Problem 2: If the spacecraft's velocity after a course correction burn was 1.5 km/s, and the mass of the spacecraft was 30,000 kg, what was the change in momentum caused by the thrusters?

Solution:

$$\Delta p = m \times \Delta v = 30,000 \times 1.5 \times 10^3 = 45,000,000 \text{ kg}\cdot\text{m/s}$$
